Mathematical Formulae

- For doing this we create a mathematical environment first by putting the formulae between two dolar signs.
- Then we write the formulae using special indices and latex features.
- We should not forget to add the dolar sign at the end of the formula, else it will result into a error.

This one was quite easy as this involves only selecting a tool and drawing a dialogue box type and then writing into it. It was very simple.

Also it is just like paint to us.

Graphviz

This was also same like the Dia application but this involved programming the flow chart.

We had to write a code for the flow chart.

It was really a fun. I enjoyed this.

This was also a fun part as we made pdf slides for presentation through coding.
Currently I am making the same thing. ;-)

Bibliography

In this it was just that, we mentioned the sources of our information.
